

COLLECT GEOLOCATION DATA FOR CUSTOM CONTENT AND MORE.

1 Obtain latitude and longitude data for each and every record in your iMIS database

Using free Google Geocoding, iMap queries the records you define for the latitude and longitude of their addresses. It then stores this information in iMIS.

3 Set it and forget it

Run this handy tool as a service. iMap will run in the background, on your server, to do its job.

2 Updates the records you select

To accommodate the record count limitation of the Google Geocoding engine, you tell iMap what addresses to prioritize, leaving non-member records for last.

4 Use it

Use the Geocoding data to provide custom content on your website and to identify member records within a given radius. Perfect for the "Find a Member" widget on your website.

CHAPTER LOCATOR

There is [1 Chapter](#) within 50 miles of you.
